$$(\mathsf{X}_1,\mathsf{X}_2) = \mathsf{R}(\mathsf{W}_1,\mathsf{W}_2), \qquad R \perp (W_1,W_2)$$

Why is this model important?

- Archimedean/Liouville copulas
- (Scale mixtures of) Gaussian copulas
- Student-t copulas
- Elliptical copulas
- Pareto copulas, includes all extreme value dependence structures

etc.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

Extreme Value Theory and Statistics

- Rare events do happen!
- Impact on various risks (health, environment, economy,...)
- Often result of simultaneous events
- Joint exceedance estimates drastically differ between AD and AI models

For $R \ge 0$: There exists $\xi \in \mathbb{R}$ and a function b(t) > 0 s.t.

$$\lim_{t \to r^*} \mathsf{P}(R > t + r/b(t) \mid R > t) = (1 + \xi r)_+^{-1/\xi}, \qquad r \ge 0.$$

where $r^* = \sup\{r : F_R(r) < 1\}$ is upper endpoint; cf. Embrechts et al. (1997).

Tail heaviness of R increases with shape ξ :

1. $\xi < 0$: *R* has upper endpoint and is in negative Weibull MDA;

2. $\xi = 0$: *R* light tailed \Rightarrow MDA of Gumbel distribution;

3. $\xi > 0$: *R* regularly varying \Rightarrow MDA of Fréchet distribution.

For $R \ge 0$: There exists $\xi \in \mathbb{R}$ and a function b(t) > 0 s.t.

$$\lim_{t \to r^*} \mathsf{P}(R > t + r/b(t) \mid R > t) = (1 + \xi r)_+^{-1/\xi}, \qquad r \ge 0,$$

where $r^* = \sup\{r : F_R(r) < 1\}$ is upper endpoint; cf. Embrechts et al. (1997).

Tail heaviness of R increases with shape ξ :

1. $\xi < 0$: *R* has upper endpoint and is in negative Weibull MDA;

2. $\xi = 0$: *R* light tailed \Rightarrow MDA of Gumbel distribution;

- 3. $\xi > 0$: *R* regularly varying \Rightarrow MDA of Fréchet distribution.
- 4. $\xi = \infty$: *R* is superheavy-tailed \Rightarrow not in any MDA.

For $R \ge 0$: There exists $\xi \in \mathbb{R}$ and a function b(t) > 0 s.t.

$$\lim_{t \to r^*} \mathsf{P}(R > t + r/b(t) \mid R > t) = (1 + \xi r)_+^{-1/\xi}, \qquad r \ge 0.$$

where $r^* = \sup\{r : F_R(r) < 1\}$ is upper endpoint; cf. Embrechts et al. (1997).

Tail heaviness of R increases with shape ξ :

1. $\xi < 0$: *R* has upper endpoint and is in negative Weibull MDA;

2. $\xi = 0$: *R* light tailed \Rightarrow MDA of Gumbel distribution;

- 3. $\xi > 0$: *R* regularly varying \Rightarrow MDA of Fréchet distribution.
- 4. $\xi = \infty$: *R* is superheavy-tailed \Rightarrow not in any MDA.

For $(W_1, W_2) \in \mathbb{R}^2$: $W_1 \stackrel{d}{=} W_2 \stackrel{d}{=} W \ge 0$ and same range of tail decays as R.

<u>Notation</u>: χ_W and η_W are tail dependence and residual tail dependence coefficient of (W_1, W_2) .

Some intuition: the "Independence Model"

$(\textbf{X}_1,\textbf{X}_2) = \textbf{R} \ (\textbf{W}_1,\textbf{W}_2), \qquad \textit{R} \perp \perp \textit{W}_1 \perp \perp \textit{W}_2$

Simple model: R, W_1 and W_2 independent, i.e., $\chi_W = 0$, $\eta_W = 1/2$.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Some intuition: the "Independence Model"

$(\mathsf{X}_1,\mathsf{X}_2) = \mathsf{R}_{\xi}(\mathsf{W}_1,\mathsf{W}_2), \qquad R \perp \!\!\!\perp W_1 \perp \!\!\!\perp W_2$

- Simple model: R_{ξ} , W_1 and W_2 independent, i.e., $\chi_W = 0$, $\eta_W = 1/2$.
- ▶ Let W₁, W₂ ~ Unif[0, 1].
- ▶ Let $R_{\xi} = F_{R_{\varepsilon}}^{-1}(U)$, with $U \sim \text{Unif}[0, 1]$, shape $\xi \in \mathbb{R}$ and

$$F_{R_{\xi}}(r) = 1 - (1 + \xi r)_{+}^{-1/\xi}, \qquad r \geq 0.$$

Proposition

Let $R \in W(\theta_R)$, $W \in W(\theta_W)$ and $\tilde{W} = \min(W_1, W_2) \in W(\theta_{\tilde{W}})$.

1. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} = \alpha_W$, $\gamma_{\tilde{W}} = \gamma_W$. Then $\chi_X = \chi_W = c_{\tilde{W}}/c_W$.

- 2. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} = \alpha_W$, $\gamma_{\tilde{W}} < \gamma_W$. Then $\chi_X = \chi_W = 0$ and $\eta_X = \eta_W = 1$.
- 3. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} > \alpha_W$. Then $\chi_X = \chi_W = 0$ and

$$\eta_X = \eta_W^{\beta_R/(\beta_R + \beta_W)} = \left(\frac{\alpha_W}{\alpha_{\tilde{W}}}\right)^{\beta_R/(\beta_R + \beta_W)}$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

4. $\beta_{\tilde{W}} > \beta_{W}$. Then $\chi_{X} = \chi_{W} = 0$. $\eta_{X} = \eta_{W} = 0$.

$$Y \in W(\theta)$$
: $P(Y > x) \sim cx^{-\gamma} \exp(-\alpha x^{\beta})$, with $\theta = (c, \gamma, \alpha, \beta)$.

Proposition

Let $R \in W(\theta_R)$, $W \in W(\theta_W)$ and $\tilde{W} = \min(W_1, W_2) \in W(\theta_{\tilde{W}})$.

1. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} = \alpha_W$, $\gamma_{\tilde{W}} = \gamma_W$. Then $\chi_X = \chi_W = c_{\tilde{W}}/c_W$.

- 2. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} = \alpha_W$, $\gamma_{\tilde{W}} < \gamma_W$. Then $\chi_X = \chi_W = 0$ and $\eta_X = \eta_W = 1$.
- 3. $\beta_{\tilde{W}} = \beta_W$, $\alpha_{\tilde{W}} > \alpha_W$. Then $\chi_X = \chi_W = 0$ and

$$\eta_X = \eta_W^{\beta_R/(\beta_R + \beta_W)} = \left(\frac{\alpha_W}{\alpha_{\tilde{W}}}\right)^{\beta_R/(\beta_R + \beta_W)}$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

4.
$$\beta_{\tilde{W}} > \beta_{W}$$
. Then $\chi_{X} = \chi_{W} = 0$. $\eta_{X} = \eta_{W} = 0$.

Example

- 3. Independence model: $\alpha_{\tilde{W}} = 2\alpha_W$ and $\eta_X = 2^{-\beta_R/(\beta_R + \beta_W)}$.
- 3. Gaussian scale mixtures: $\eta_X = \{(1 + \rho_W)/2\}^{\beta_R/(\beta_R+2)}$.

The "Independence model"

Angle W	Super-heavy	Reg. varying	Weibull	Neg. Weibull

Conclusion

We unify theory and cover/extend existing examples:

Archimedean/Liouville copulas:

Larsson & Nešlehová (2011), Belzile & Nešlehová (2017)

- ▶ (Scale mixtures of) Gaussian copulas: Sibuya (1960), Huser et al. (2017)
- Student-t copulas
- Pareto copulas
- Elliptical copulas
- ▶ Recent AI models Wadsworth et al. (2017), Huser & Wadsworth (2018)

Nikoloulopoulos et al. (2012)

Rootzén et al. (2006)

Conclusion

We unify theory and cover/extend existing examples:

Archimedean/Liouville copulas:

Larsson & Nešlehová (2011), Belzile & Nešlehová (2017)

- ▶ (Scale mixtures of) Gaussian copulas: Sibuya (1960), Huser et al. (2017)
- Student-t copulas
- Pareto copulas
- Elliptical copulas
- Recent AI models Wadsworth et al. (2017), Huser & Wadsworth (2018)

We build new models bridging between AD and AI:

- "Independence model"
- "Spiky norm model"
- etc.
