Subspace Codes for Network Coding

Background

Rank-Metric-Automorphism Groups

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress Koetter and Kschischang show subspace codes are valuable for error correction of network coding.

- A subspace code is a non-empty collection C of subspaces of \mathbb{F}_{q}^{n} .
- Constant-dimension subspace codes: all the codewords (subspaces) have fixed dimension *l*.
- The subspace distance between U and V is

 $d_S(U,V) = \dim(U+V) - \dim(U \cap V)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Nebraska Subspace Code Construction

Background

Rank-Metric-Automorphism Groups

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress

- Matrix code: A subset $T \subseteq \mathbb{F}_q^{l \times m}$.
- Lifted matrix code: A constant-dimension subspace code where all the RREF matrices corresponding to each codeword have the same pivot locations, and the non-pivot locations are filled by the entries of a matrix from a matrix code.

E.g. $C = \{ \operatorname{rowspan}[I|A] : A \in T \}$ for some code $T \subseteq \mathbb{F}_q^{l \times m}$.

• Silva, Kschischang, and Koetter show that the subspace distance between $U = \operatorname{rowspan}[I|A]$ and $V = \operatorname{rowspan}[I|B]$ is

$$d_S(U, V) = 2 \operatorname{rank}(A - B)$$

Nebraska Subspace Code Construction Cont'd

Background

Equivalence of Rank-Metric Codes

Background

Rank-Metric-Automorphism Groups

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress Any invertible \mathbb{F}_{q^m} -linear map $f : \mathbb{F}_{q^m}^n \to \mathbb{F}_{q^m}^n$ that preserves rank weight is called a rank-metric equivalence map.

Theorem (Berger)

The set of rank-metric equivalence maps $G_{RM}(\mathbb{F}_{q^m}^n)$ is generated by the non-zero \mathbb{F}_{q^m} -scalar multiplications and the linear group $\operatorname{GL}_n(\mathbb{F}_q)$. The group is isomorphic to the product $(\mathbb{F}_{q^m}^*/\mathbb{F}_q^*) \times \operatorname{GL}_n(\mathbb{F}_q)$.

Note: For $f \in G_{RM}(\mathbb{F}_{q^m}^n)$, we represent f by an ordered pair (α, A) for some $\alpha \in \mathbb{F}_{q^m}^*$, $A \in \mathrm{GL}_n(\mathbb{F}_q)$.

The rank-metric automorphism group $Aut_{RM}(C)$ of a code $C \subseteq \mathbb{F}_{q^m}^n$ is the set of rank-metric equivalence maps $f \in G_{RM}(\mathbb{F}_{q^m}^n)$ satisfying f(C) = C.

Gabidulin codes

Background

Rank-Metric-Automorphism Groups

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress • The $[n, k, n-k+1]_{q^m}$ rank-metric code C_{k,\mathbf{g},q^m} with generator matrix

$$G = \begin{bmatrix} g_1, & g_2, & \dots, & g_n \\ g_1^{q^1}, & g_2^{q^1}, & \dots, & g_n^{q^1} \\ \vdots & \vdots & \vdots & \vdots \\ g_1^{q^{(k-1)}}, & g_2^{q^{(k-1)}}, & \dots, & g_n^{q^{(k-1)}} \end{bmatrix}$$

where the entries of $\mathbf{g} = [g_1, \dots, g_n] \in \mathbb{F}_{q^m}^n$ are linearly independent over \mathbb{F}_q , is called a Gabidulin code.

- Gabidulin codes are q^m -ary analogues of Reed-Solomon codes that are optimal for the rank metric.
- Used in the first subspace code construction by Koetter and Kschischang; also used in the GPT public-key cryptosystem.

Rank-Metric-Automorphism Group of Gabidulin Codes

Background

Rank-Metric-Automorphism Groups

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress

Theorem

Let $k \leq n \leq m$. Let $\mathbf{g} = [g_1, \ldots, g_n] \in \mathbb{F}_{q^m}^n$ have entries that are linearly independent over \mathbb{F}_{q} , and let C_{k,\mathbf{g},q^m} be the Gabidulin code of dimension k generated by \mathbf{g} . Let d be the largest integer such that $\langle g_1, \ldots, g_n \rangle_{\mathbb{F}_q}$ is a vector space over $\mathbb{F}_{q^d} \subseteq \mathbb{F}_{q^m}$. Then

• d divides gcd(n,m).

$$\begin{aligned} \mathbf{A}ut_{RM}(C_{k,\mathbf{g},q^m}) &= \\ \left\{ \left(\alpha, \epsilon_{\mathbf{g}} \left(\left[\beta g_1, \dots, \beta g_n \right] \right)^\top \right) : \alpha \in \mathbb{F}_{q^m}^*, \ \beta \in \mathbb{F}_{q^d}^* \right\}. \end{aligned}$$

Nebraska Lincoln

Equivalence of Matrix Codes

A matrix-equivalence map is an invertible \mathbb{F}_q -linear map $f: \mathbb{F}_q^{n \times m} \to \mathbb{F}_q^{n \times m}$ that preserves rank weight.

Theorem

Rank-Metric-Automorphism Groups

Background

Equivalence of Matrix Codes

Matrix-Automorphism Groups

Work in Progress Let $f \in G_{Mat}(\mathbb{F}_q^{n \times m})$ be a matrix-equivalence map. If $n \neq m$, then there exist $A \in GL_n(\mathbb{F}_q)$, $B \in GL_m(\mathbb{F}_q)$ such that

•
$$f(M) = AMB$$
 for all $M \in \mathbb{F}_q^{n \times m}$

If n = m, then there exist $A, B \in \operatorname{GL}_n(\mathbb{F}_q)$ such that either

•
$$f(M) = AMB$$
 for all $M \in \mathbb{F}_q^{n imes m}$, or

•
$$f(M) = AM^{\top}B$$
 for all $M \in \mathbb{F}_q^{n \times m}$

Note: When $n \neq m$,

 $G_{Mat}(\mathbb{F}_q^{n \times m}) \cong \mathrm{GL}_n(\mathbb{F}_q) \times \mathrm{PGL}_m(\mathbb{F}_q),$

and so we can choose a representative for $f \in G_{Mat}(\mathbb{F}_q^{n \times m})$ of the form (A, B) where $A \in \operatorname{GL}_n(\mathbb{F}_q)$ and $B \in \operatorname{GL}_m(\mathbb{F}_q)_2$, we have $A \in \operatorname{GL}_n(\mathbb{F}_q)$ and $B \in \operatorname{GL}_m(\mathbb{F}_q)_2$.

Matrix-Automorphism Group of Gabidulin Codes

The matrix-automorphism group $Aut_{Mat}(C)$ of a code $C \subseteq \mathbb{F}_q^{n \times m}$ is the set of matrix-equivalence maps that fix C.

Theorem

Equivalence of Matrix Codes
