local pair crossing number, 51

local toroidal crossing number, 11, 26, **49**

major crossing number, 26, **55**

map crossing number, 21, **52**, 70

maximal crossing number, 53

maximal rectilinear crossing number, 54

maximum convex rectilinear crossing number, 35

maximum crossing number, 7, 8, 22, 26, **53**, 54

maximum orchard crossing number, 22, 26, **58**

maximum rectilinear crossing number, 5, 7, 22, **53**, 53

maximum rectilinear edge crossing number, 26, 41

Metro-line crossing number, 15, 23, 33, **54**, 70

minimum non-crossing edge number, 41

minor crossing number, 8, 11, 14, 26, 42, **55**, 66

mixed upward crossing number, **68**

monotone crossing number, 18, 19, 26, 32, 42, 49, **56**, 56, 57, 60

monotone crossing numbers, **56**, 71

monotone independent odd crossing number, 11, 26, 57

monotone odd crossing number, 5, 17, 26, **56**, 56, 57, 62

monotone odd + crossing number, 27

monotone odd \pm crossing number, 27

monotone pair crossing number, 27, **56**, 56, 57, 59

monotone semisimple odd crossing number, 56

monotone weakly semisimple odd crossing number, 56

multiplanar crossing numbers, 49

nodal crossing number, 12, 27, **57**

nodal toroidal crossing number, 27, 57

non-crossing edge number, 41

non-orientable genus g crossing number, 27

obfuscation complexity, 54

odd crossing number, 5, 9, 15, 17, 22, 27, 46, 57, **58**, 59, 71

odd + crossing number, 27, **56**, 58, 71

odd \pm crossing number, **56**

odd \pm crossing number, 58

Solutions to Last Month's Puzzles.

146.—WATER, GAS, AND ELECTRICITY.

ACCORDING to the conditions, in the strict sense in

which one at first understands them, there is no possible solution to this puzzle. In such a dilemma one always has to look for some verbal quibble or trick. If the owner of house A will allow the water company to run their pipe for house C through his property (and we are not bound to assume that he would object), then the difficulty is got over, as shown in our illustration.

It will be seen that the dotted line from W to C passes through house A, but no pipe ever crosses another pipe.

Definition

The *(graph) crossing number*, $cr(G)$, of a graph G is the smallest number of crossings in any drawing of G .

- drawn where? Plane, surface, book, ...
- drawn how?
 - how is the graph represented?
 - how is the representation visualized?
- how are crossings counted?

Maximum Crossing Numbers

Definition

$\max\text{-}\overline{cr}(G)$ = largest # crossings in
rectilinear (straight-line) drawing of G

$\max\text{-}cr(G)$ = largest # crossings in
good drawing of G

$$\max\text{-}cr(C_4) = \max\text{-}\overline{cr}(C_4) = 1$$

Maximum Crossing Numbers

$$\max\text{-cr}(K_n) = \max\text{-}\overline{\text{cr}}(K_n) = \binom{n}{4}$$

Polygons and Cycles

$$\max\text{-cr}(C_n) = \frac{n(n-3)}{2} \text{ for } n \geq 4$$

$$\max\text{-}\overline{\text{cr}}(C_n) = \begin{cases} n(n-3)/2 & \text{if } n \text{ is odd,} \\ n(n-4)/2 + 1 & \text{if } n \text{ is even.} \end{cases}$$

Thackle Bound

$$\vartheta(G) := \frac{1}{2} \sum_{uv} (m - \deg(u) - \deg(v) + 1)$$

Lemma

$$\mathit{max-cr}(G) \leq \vartheta(G)$$

Theorem (Piazza, Ringeisen, Stueckle [PRS88])

$$\mathit{max-cr}(F) = \vartheta(F) \text{ if } F \text{ is a forest}$$

Theorem (Verbitsky [V08])

$$\frac{\vartheta(G)}{3} \leq \mathit{max-\overline{cr}}^o(G) \leq \vartheta(G)$$

Maximum Crossing Number

Question: $\max\text{-}\overline{cr}^0(G) = \max\text{-}\overline{cr}(G)$?

Answer: no. [CFKUVW17]

What if G is bipartite? A tree?
yes for spiders and trees of diameter
at most 4 [BET18, FHKLS18]

What if drawing is *separated* (all
edges crossed by a line)?

Question: $\exists \mathbb{R}$ -complete?

Known to be NP-hard [BJL16]

Subgraph Monotonicity

Question: If G is (induced) subgraph of H ,
then $\max\text{-cr}(G) \leq \max\text{-cr}(H)$?

- True for $\max\text{-}\overline{\text{cr}}(G)$ (even pseudolinear cr)
- Conditions on G which make this happen?

“Aura”/partial join Technique

Theorem

If C_n is induced subgraph of H ,
then $\max\text{-cr}(C_n) \leq \max\text{-cr}(H)$.

- True for odd n and C_4
- True for C_6 (pic on left)
- Replace edge with P_3
- Add spokes

“Aura”/partial join Technique

Theorem

If C_n is induced subgraph of H ,
then $\max\text{-cr}(C_n) \leq \max\text{-cr}(H)$.

Question: Is monotonicity conjecture true for (induced) subgraphs?

Exercise: Show that $\max\text{-cr}(G) \leq \max\text{-cr}(H)$ for G apex, and induced subgraph of H .

Maximum Crossing Number

Question: Is there a formula for $\max\text{-}\overline{cr}(T)$
if T is a tree?

Theorem (Piazza, Ringeisen, Stueckle [PRS88])
 $\max\text{-}cr(F) = \vartheta(F)$ if F is a forest

All caterpillars are thrackable,
Subdivided $K_{1,3}$ is not.

yes for spiders and trees of diameter
at most 4 [BET18, FHKLSS18]

Conway's Thrackle Conjecture

If a graph can be drawn in the plane so that every two edges intersect once, then $|E| \leq |V|$.

Current best bound: $|E| \leq 1.3984|V|$ (Fulek, Pach [FP17])

Local Crossing Number

Definition

The *local crossing number*, $lcr(D)$, of a drawing D is the largest number of crossings along any edge in D .

The *local crossing number*, $lcr(G)$, of a graph G is the smallest $lcr(D)$ of any drawing D of G .

$$lcr(K_6) = 1$$

$$lcr(K_7) = 2$$

Simple Local Crossing Number

Definition

The *simple local crossing number*, $lcr^*(G)$, of a graph G is the smallest $lcr(D)$ of any **good** drawing D of G .

Theorem (Pach, Radoičič, Tardos, Tóth [PRTT06])

If $lcr(G) \leq 3$, then $lcr(G) = lcr^*(G)$.

Used for better lower bound in crossing lemma

Simple \neq Non-Simple

Theorem

There is G with $lcr(G) = 4$ and $lcr^*(G) = 5$.

Question: can $lcr^*(G)$ be bounded in $lcr(G)$?

Local Crossing Number

$$lcr(K_6) = 1$$

$$lcr(K_7) = 2$$

Question: $lcr(K_n)$?
 $lcr(K_{m,n})$?

$\overline{lcr}(K_n)$ is known for all n (Ábrego, Fernandez-Merchant [AF17])

$\overline{lcr}(K_{m,n})$ is known for $m = 3, 4$ [ADFLSS17].

Local Crossing Number Literature

Independent Crossing Number

Definition

The *independent crossing number*, $cr_-(G)$, of a graph G is the smallest number of crossings between independent edges in any drawing of G .

Lemma $cr_-(G) = cr(G)$

Proof

- fix drawing D of G with smallest number of crossings
- D cannot have dependent crossings
- so $cr_-(D) = cr(D)$

Independent Crossing Number

Definition

The *independent crossing number*, $cr_-(G)$, of a graph G is the **Open** least number of crossings between independent edges in any drawing of G .

Lemma $cr_-(G) = cr(G)$

Proof

- fix drawing D of G with smallest number of crossings
- D cannot have dependent crossings
- so $cr_-(D) = cr(D)$

Independent Crossing Number

Question: $cr(G) = cr_-(G)$?

- bound cr in terms of cr_- (best bound quadratic)
- bound $cr(D)$ of a $cr_-(G)$ -minimal drawing
(exponential bound possible)
- easier for $G = K_n$?

Independent Crossing Number

Conjecture:

If a graph can be drawn on a surface without independent crossings. Then graph can be embedded in surface.

Known for

plane (Hanani-Tutte theorem)

projective plane (HT for PP)

HT fails for orientable surfaces of genus ≥ 4 .

Rectilinear Crossing number

Definition

The *rectilinear crossing number*, $\overline{cr}(G)$, of a graph G is the smallest number of crossings in any straight-line drawing of G .

Theorem (Fary, 48; Wagner, 36)

If G is planar, then G has a planar straight-line drawing.

Theorem (Bienstock, Dean, 93)

$$\overline{cr}(G) = cr(G) \text{ for } cr(G) \leq 3.$$

Independent Crossing Number Literature

[S10] Marcus Schaefer. Removing Incident Crossings. Manuscript, 2010.

[

Rectilinear Crossing number

Definition

The *rectilinear crossing number*, $\overline{cr}(G)$, of a graph G is the smallest number of crossings in any straight-line drawing of G .

Theorem (Fary, 48; Wagner, 36)

If G is planar, then G has a planar straight-line drawing.

Theorem (Bienstock, Dean, 93)

$$\overline{cr}(G) = cr(G) \text{ for } cr(G) \leq 3.$$

Conjectures and Question

Conjecture (Harary, Kainen, Schwenk [HLS73])

$$\overline{cr}(C_m \square C_n) = n(m - 2) \text{ for } n \geq m \geq 3.$$

Also open for $cr(G)$. For that case, partial results known.

Conjecture (Hernández-Vélez, Leaños, Salazar [HLS17])

$\overline{cr}(G)$ can be bounded in $cr(G)$ for 3-connected G .

Question: Can \overline{cr} be bounded in $\tilde{cr}(G)$?

Question: What's the complexity of $\overline{cr}(G) \leq 4$?

Grid Drawings

Question: Is there an f so that
if $\overline{cr}(G) \leq k$ and $n = |V(G)|$, then
 G can be realized on a $f(k)n \times f(k)n$ grid?

Alternatively: on an $n^{f(k)} \times n^{f(k)}$ grid?

Question: If we restrict drawing D of G to a $t \times t$ grid,
what is the best $\overline{cr}(D)$ we can guarantee?

If $t = \Omega(2^{2^n})$, then we can achieve $\overline{cr}(G)$.

Rectilinear Crossing Number Literature

[BD93] Daniel Bienstock and Nathaniel Dean. Bounds for rectilinear crossing numbers. *J. Graph Theory*, 17(3):333–348, 1993.

[HKS73] Frank Harary, Paul C. Kainen, and Allen J. Schwenk. Toroidal graphs with arbitrarily high crossing numbers. *Nanta Math.*, 6(1):58–67, 1973.

[HLS17] César Hernández-Vélez, Jesús Leaños, and Gelasio Salazar. On the pseudolinear crossing number. *Journal of Graph Theory*, 84(3):297–310, 2017.

Counting Crossings

$cr(D) = \#$ of crossings in D

$pcr(D) = \#$ of **pairs of edges** crossing in D

$ocr(D) = \#$ of pairs of edges crossing **oddly** in D

$ocr_-(D) = \#$ of pairs of **independent** edges crossing
oddly in D

$$ocr_-(G) \leq ocr(G) \leq pcr(G) \leq cr(G)$$

Drawing D of K_4

The Hanani-Tutte Theorem

Theorem (Hanani, 1934; Tutte, 1970)

$$ocr_-(G) = 0 \text{ implies } cr(G) = 0$$

$$ocr_-(G) = ocr(G) = pcr(G) = cr(G) ?$$

Answer: Not all. [FPSS12]

There is G so that $ocr_-(G) < ocr(G) < pcr(G)$

Conjecture $pcr(G) = cr(G)$

Bounds?

Theorem (Matousek [M14])

$$cr(G) \leq pcr(G)^{\frac{3}{2}} \log^2(pcr(G))$$

$\log^2(pcr(G))$ can be improved to $\log(pcr(G))$
using string graph separator by Lee.

Theorem (Pelsmajer, Schaefer, Štefankovič [PSS10])

$$cr(G) \leq \binom{2ocr_-(G)}{2}$$

Question: sub-quadratic bounds for cr in ocr_- ?

Crossing Lemma for $pcr(G)$

remove each vertex of $G = (V, E)$ with prob. p i.a.r.

$$G' = (V', E') \quad cr(G') \geq |E'| - 3|V'|$$

$$\mathbb{E}(cr(G')) \geq \mathbb{E}(|E'|) - 3\mathbb{E}(|V'|)$$

$$p^4 cr(G) \geq p^2 |E| - 3p |V|$$

can replace cr with pcr?

$$cr(G) \geq p^{-2} |E| - 3p^{-3} |V|$$

$$cr(G) \geq \frac{|E|^3}{64|V|^2} \quad \text{e.g. } p = 4|V|/|E|$$

Improved Crossing Lemma for $pcr_+(G)$

pcr_+ : no adjacent crossings allowed

Theorem (Ackerman, Schaefer [AS14])

$$pcr_+(G) \geq \frac{1}{32.4} \frac{m^3}{n^2} \text{ for } m \geq 6.75 n.$$

use $lpcr(G) \leq 2$, then $lcr(G) \leq lpcr(G)$

Questions:

$lpcr(G) \leq 3$, then $lcr(G) \leq lpcr(G)$

$lpcr_-(G) \leq 1$, then $lcr(G) \leq 1$?

Question: What is the oldest reference to crossing numbers?

From de la Vera Cruz' *Recognitio Summularum*, 1554 (<http://www.primeroslibros.org/browse.html>)

In actual practice, especially with large groups, it has been convenient to use counters with each subject's name and score written on them. (White poker chips have served admirably.) These are moved in the circles to which their score belongs and arranged to get the best "fit" among the individuals, i.e., to have as few long lines and crossing lines as possible. In plotting the diagram when public school

From Mary L. Northway. *A Method for Depicting Social Relationships Obtained by Sociometric Testing*. *Sociometry*, Vol. 3, No. 2 (Apr., 1940), pp. 144-150
