Eli Putterman Tel Aviv University The log-Brunn-Minkowski inequality and its local version

Outline

- 2 Alternative formulations and applications
- 3 The local log-Brunn-Minkowski inequality

4 E 5 4

The Brunn-Minkowski inequality

 $K, L \subset \mathbb{R}^n$ convex bodies

$$\operatorname{vol}(K+L)^{\frac{1}{n}} \ge \operatorname{vol}(K)^{\frac{1}{n}} + \operatorname{vol}(L)^{\frac{1}{n}}$$

→ < Ξ → <</p>

The Brunn-Minkowski inequality

 $\mathcal{K}, \mathcal{L} \subset \mathbb{R}^n$ convex bodies, $\lambda \in [0, 1]$

$$\operatorname{vol}((1-\lambda)K+\lambda L)^{rac{1}{n}} \geq (1-\lambda)\operatorname{vol}(K)^{rac{1}{n}}+\lambda\operatorname{vol}(L)^{rac{1}{n}}$$

→ < Ξ → <</p>

The Brunn-Minkowski inequality

 $\mathcal{K}, \mathcal{L} \subset \mathbb{R}^n$ convex bodies, $\lambda \in [0,1]$

$$\operatorname{vol}((1-\lambda)K+\lambda L)^{rac{1}{n}} \geq (1-\lambda)\operatorname{vol}(K)^{rac{1}{n}}+\lambda\operatorname{vol}(L)^{rac{1}{n}}$$

where

$$(1-\lambda)K + \lambda L = \{x : \langle x, u \rangle \leq (1-\lambda)h_{K}(u) + \lambda h_{L}(u) \, \forall u \in S^{n-1}\}$$

.

The Brunn-Minkowski inequality

 $K, L \subset \mathbb{R}^n$ convex bodies, $\lambda \in [0, 1]$ $\operatorname{vol}((1 - \lambda)K + \lambda L)^{\frac{1}{n}} \ge (1 - \lambda)\operatorname{vol}(K)^{\frac{1}{n}} + \lambda \operatorname{vol}(L)^{\frac{1}{n}}$

where

$$(1-\lambda)K + \lambda L = \{x : \langle x, u \rangle \leq (1-\lambda)h_K(u) + \lambda h_L(u) \, \forall u \in S^{n-1}\}$$

with equality iff K, L are homothetic.

伺 ト イヨ ト イヨト

The Brunn-Minkowski-Firey inequality (Firey, 1962)

 $K, L \subset \mathbb{R}^n$ convex bodies, $\lambda \in [0, 1]$

$$\operatorname{vol}((1-\lambda)K +_{p} \lambda L)^{\frac{p}{n}} \geq (1-\lambda)\operatorname{vol}(K)^{\frac{p}{n}} + \lambda\operatorname{vol}(L)^{\frac{p}{n}}$$

.

The Brunn-Minkowski-Firey inequality (Firey, 1962)

$$K, L \subset \mathbb{R}^n$$
 convex bodies, $\lambda \in [0, 1]$

$$\operatorname{vol}((1-\lambda)K +_p \lambda L)^{\frac{p}{n}} \ge (1-\lambda)\operatorname{vol}(K)^{\frac{p}{n}} + \lambda\operatorname{vol}(L)^{\frac{p}{n}}$$

where

$$(1-\lambda)\mathcal{K}+_{p}\lambda L = \{x: \langle x, u \rangle \leq ((1-\lambda)h_{\mathcal{K}}(u)^{p}+\lambda h_{L}(u)^{p})^{\frac{1}{p}} \forall u \in S^{n-1}\}$$

with equality iff K, L are homothetic.

4 3 6 4 3

The Brunn-Minkowski-Firey inequality (Firey, 1962)

 $K, L \subset \mathbb{R}^n$ convex bodies, $\lambda \in [0, 1]$

$$\operatorname{vol}((1-\lambda)K +_p \lambda L)^{\frac{p}{n}} \ge (1-\lambda)\operatorname{vol}(K)^{\frac{p}{n}} + \lambda\operatorname{vol}(L)^{\frac{p}{n}}$$

where

$$(1-\lambda)\mathcal{K}+_{p}\lambda L = \{x: \langle x, u \rangle \leq ((1-\lambda)h_{\mathcal{K}}(u)^{p}+\lambda h_{L}(u)^{p})^{\frac{1}{p}} \forall u \in S^{n-1}\}$$

with equality iff K, L are homothetic.

... if $p \ge 1$.

-

The conjectured L^{p} -BM inequality (BLYZ, 2012)

 $K, L \subset \mathbb{R}^n$ centrally symmetric convex bodies, $\lambda \in [0, 1]$, $p \in (0, 1]$

$$\mathsf{vol}((1-\lambda)\mathcal{K}+_p\lambda L)^{rac{p}{n}}\geq (1-\lambda)\,\mathsf{vol}(\mathcal{K})^{rac{p}{n}}+\lambda\,\mathsf{vol}(L)^{rac{p}{n}}$$

where

$$(1-\lambda)\mathcal{K}+_{p}\lambda L = \{x: \langle x, u \rangle \leq ((1-\lambda)h_{\mathcal{K}}(u)^{p}+\lambda h_{L}(u)^{p})^{\frac{1}{p}} \forall u \in S^{n-1}\}$$

with equality iff K, L are homothetic.

-1

The conjectured L^{p} -BM inequality (BLYZ, 2012)

 $K, L \subset \mathbb{R}^n$ centrally symmetric convex bodies, $\lambda \in [0, 1]$, $p \in (0, 1]$

$$\mathsf{vol}((1-\lambda)\mathcal{K}+_p\lambda L)^{rac{p}{n}}\geq (1-\lambda)\,\mathsf{vol}(\mathcal{K})^{rac{p}{n}}+\lambda\,\mathsf{vol}(L)^{rac{p}{n}}$$

where

$$(1-\lambda)\mathcal{K}+_{p}\lambda L = \{x: \langle x, u \rangle \leq ((1-\lambda)h_{\mathcal{K}}(u)^{p}+\lambda h_{L}(u)^{p})^{\frac{1}{p}} \forall u \in S^{n-1}\}$$

with equality iff K, L are homothetic.

$$h_{(1-\lambda)K+_p\lambda L}
eq ((1-\lambda)h_K(u)^p + \lambda h_L(u)^p)^{\frac{1}{p}}$$
 in general!

The conjectured log-BM inequality (BLYZ, 2012)

 $K, L \subset \mathbb{R}^n$ centrally symmetric convex bodies, $\lambda \in [0, 1]$

$$\mathsf{vol}((1-\lambda)\mathcal{K}+_o\lambda L)^{rac{1}{n}}\geq\mathsf{vol}(\mathcal{K})^{1-\lambda}\,\mathsf{vol}(L)^\lambda$$

where

$$(1-\lambda)K+_o\lambda L=\{x:\langle x,u
angle\leq h_{\mathcal{K}}(u)^{1-\lambda}h_L(u)^\lambda\,\forall u\in S^{n-1}\}$$

with equality iff K, L are similar.

• • = = • • = =

The conjectured log-BM inequality (BLYZ, 2012)

 $K, L \subset \mathbb{R}^n$ centrally symmetric convex bodies, $\lambda \in [0, 1]$

$$\mathsf{vol}((1-\lambda)\mathcal{K}+_o\lambda L)^{rac{1}{n}}\geq\mathsf{vol}(\mathcal{K})^{1-\lambda}\,\mathsf{vol}(L)^\lambda$$

where

$$(1-\lambda)K +_o \lambda L = \{x : \langle x, u \rangle \le h_K(u)^{1-\lambda}h_L(u)^\lambda \, \forall u \in S^{n-1}\}$$

with equality iff K, L are similar.

Again,
$$h_{(1-\lambda)K+_o\lambda L}
eq h_K^{1-\lambda} h_L^{\lambda}$$
 in general.

イロト イポト イヨト イヨト ニヨー

Minkowski uniqueness

The Minkowski inequality (1)

 $K, L \subset \mathbb{R}^n$ convex bodies $\Rightarrow \operatorname{vol}(K)^{\frac{n-1}{n}} \operatorname{vol}(L)^{\frac{1}{n}} \leq \frac{1}{n} \int h_L \, dS_K$, with equality iff K, L are homothetic.

• • • • • • •

Minkowski uniqueness

The Minkowski inequality (1)

 $K, L \subset \mathbb{R}^n$ convex bodies $\Rightarrow \operatorname{vol}(K)^{\frac{n-1}{n}} \operatorname{vol}(L)^{\frac{1}{n}} \leq \frac{1}{n} \int h_L \, dS_K$, with equality iff K, L are homothetic.

Minkowski uniqueness (2)

If two convex bodies K, L have the same surface area measure, they are translates.

Minkowski uniqueness

The Minkowski inequality (1)

 $K, L \subset \mathbb{R}^n$ convex bodies $\Rightarrow \operatorname{vol}(K)^{\frac{n-1}{n}} \operatorname{vol}(L)^{\frac{1}{n}} \leq \frac{1}{n} \int h_L \, dS_K$, with equality iff K, L are homothetic.

Minkowski uniqueness (2)

If two convex bodies K, L have the same surface area measure, they are translates.

(1) \Rightarrow (2): Multiply $dS_K = dS_L$ by h_K and integrate; use (1) to show that that $vol(K) \le vol(L)$. By the same argument, $vol(L) \le vol(K)$, so $vol(K) = vol(L) = \frac{1}{n} \int h_L dS_K$.

Minkowski uniqueness

The Minkowski inequality (1)

 $K, L \subset \mathbb{R}^n$ convex bodies $\Rightarrow \operatorname{vol}(K)^{\frac{n-1}{n}} \operatorname{vol}(L)^{\frac{1}{n}} \leq \frac{1}{n} \int h_L \, dS_K$, with equality iff K, L are homothetic.

Minkowski uniqueness (2)

If two convex bodies K, L have the same surface area measure, they are translates.

(2) \Rightarrow (1): For given K, let K_0 minimize the functional $f(h_L) = \operatorname{vol}(L)^{-\frac{1}{n}} \int h_L dS_K$; wlog $\operatorname{vol}(K_0) = \operatorname{vol}(K)$. We claim K_0 is homothetic to K.

・ 同 ト ・ ヨ ト ・ ヨ ト

Minkowski uniqueness

The Minkowski inequality (1)

 $K, L \subset \mathbb{R}^n$ convex bodies $\Rightarrow \operatorname{vol}(K)^{\frac{n-1}{n}} \operatorname{vol}(L)^{\frac{1}{n}} \leq \frac{1}{n} \int h_L \, dS_K$, with equality iff K, L are homothetic.

Minkowski uniqueness (2)

If two convex bodies K, L have the same surface area measure, they are translates.

(2) \Rightarrow (1): For given K, let K_0 minimize the functional $f(h_L) = \operatorname{vol}(L)^{-\frac{1}{n}} \int h_L dS_K$; wlog $\operatorname{vol}(K_0) = \operatorname{vol}(K)$. We claim K_0 is homothetic to K.

For any $\varphi \in C(S^{n-1})$, let $g(t) = f(h_{K_0} + t\varphi)$; we must have g'(0) = 0, giving $\int \varphi \, dS_{K_0} = \int \varphi \, dS_K \Rightarrow S_K = S_{K_0}$. Now use (2).

Log-Minkowski uniqueness

The conjectured log-Minkowski inequality

 $K, L \text{ c.s. convex bodies} \Rightarrow \frac{1}{n} \frac{\operatorname{vol}(L)}{\operatorname{vol}(K)} \leq \int h_K \log \frac{h_L}{h_K} dS_K$ with equality iff K, L are similar: that is, there exist c.s. convex bodies $K_1, \ldots, K_m, \alpha_i > 0, T \in GL_n$ such that $K = T(K_1 \times \cdots \times K_m)$ and $L = T(\alpha_1 K_1 \times \cdots \otimes \alpha_m K_m)$.

Local log-BM and local *p*-BM

Theorem (Colesanti-Livshyts-Marsiglietti)

Set $K = B_2^n$. Then for $L \in \mathcal{K}_{+,e}^n$ close enough to K, the log-Brunn-Minkowski inequality holds for K, L.

Write $h_L = e^{\varphi}$, $K_{\lambda} = (1 - \lambda)K +_o \lambda L$. Then $h_{K_{\lambda}} = e^{\lambda \varphi}$ for all $\lambda \in [0, 1]$. Substitute in

$$\operatorname{vol}(K_{\lambda}) = \frac{1}{n} \int_{S^{n-1}} h_{K_{\lambda}} dS_{K_{\lambda}} = \frac{1}{n} \int_{S^{n-1}} h_{K_{\lambda}} \det[D^2 h_{K_{\lambda}}] d\sigma.$$

Using some linear algebra, we compute that $n^2 \kappa_n \log \operatorname{vol}(K_\lambda)''(0)$ equals

$$n\int \varphi^2 \, d\sigma - \int_{S^{n-1}} |\nabla \varphi|^2 \, d\sigma - \frac{1}{\kappa_n} \left(\int_{S^{n-1}} \varphi \, d\sigma \right)^2$$

Decomposing into spherical harmonics shows this is nonpositive!

Local L^p-Brunn-Minkowski

Kolesnikov-Milman generalized in two directions:

• Work with L^p -Brunn-Minkowski for any $p \in [0, 1]$.

伺 ト イヨト イヨト

Local L^p-Brunn-Minkowski

Kolesnikov-Milman generalized in two directions:

< 同 > < 三 > < 三 >

Local L^p-Brunn-Minkowski

Kolesnikov-Milman generalized in two directions:

- Work with L^p -Brunn-Minkowski for any $p \in [0, 1]$.
- Consider local behavior near any $K \in \mathcal{K}^n_{+,e}$, not just B^n_2 .

They showed that $(\operatorname{vol}(K_{\lambda})^{\frac{p}{n}})''(0) \leq 0$ implies that for all $\varphi \in C^{2}(S^{n-1})$,

$$\frac{n-1}{n-p}V(\varphi h_{\mathcal{K}}[2],\mathcal{K}[n-2]) + \frac{1-p}{n-p}V(\varphi^2 h_{\mathcal{K}}[1],\mathcal{K}[n-1]) - \frac{V(\varphi h_{\mathcal{K}}[1],\mathcal{K}[n-1])^2}{\operatorname{vol}(\mathcal{K})} \leq 0$$

Using spectral methods, they proved this inequality for $p \in [p_0(n), 1]$.

• (1) • (

Why local-to-global is nontrivial

Whenever $h_{K_{\lambda}} = (1 - \lambda)h_{K} +_{p} \lambda h_{L}$ on some neighborhood, vol $(K_{\lambda})^{\frac{p}{n}}$ is twice differentiable with second derivative given by the LHS of the local L^{p} -BM inequality.

(四) (日) (日)

Why local-to-global is nontrivial

Whenever $h_{K_{\lambda}} = (1 - \lambda)h_{K} +_{p} \lambda h_{L}$ on some neighborhood, vol $(K_{\lambda})^{\frac{p}{n}}$ is twice differentiable with second derivative given by the LHS of the local L^{p} -BM inequality.

In particular, this is true for any $K, L \in \mathcal{K}^n_{+,e}$ and small enough λ , so global L^p -BM implies the local version.

Why local-to-global is nontrivial

Whenever $h_{K_{\lambda}} = (1 - \lambda)h_{K} +_{p} \lambda h_{L}$ on some neighborhood, vol $(K_{\lambda})^{\frac{p}{n}}$ is twice differentiable with second derivative given by the LHS of the local L^{p} -BM inequality.

In particular, this is true for any $K, L \in \mathcal{K}^n_{+,e}$ and small enough λ , so global L^p -BM implies the local version.

But in general, $h_{K_{\lambda}} \neq (1 - \lambda)h_{K} +_{p} \lambda h_{L}$, because the RHS isn't necessarily convex for $p \in [0, 1)$.

• A B • • B • • B •

Why local-to-global is nontrivial

Whenever $h_{K_{\lambda}} = (1 - \lambda)h_{K} +_{p} \lambda h_{L}$ on some neighborhood, vol $(K_{\lambda})^{\frac{p}{n}}$ is twice differentiable with second derivative given by the LHS of the local L^{p} -BM inequality.

In particular, this is true for any $K, L \in \mathcal{K}^n_{+,e}$ and small enough λ , so global L^p -BM implies the local version.

But in general, $h_{K_{\lambda}} \neq (1 - \lambda)h_{K} +_{p} \lambda h_{L}$, because the RHS isn't necessarily convex for $p \in [0, 1)$.

It turns out that the first derivative of $vol(K_{\lambda})$ can be computed despite this problem (Alexandrov's lemma), but the second derivative seems out of reach in general.

Local L^p-Brunn-Minkowski and Minkowski uniqueness

Recall:

L^p-BM inequality (with equality condition) ⇔ L^p-Minkowski inequality (with equality condition).

Local L^p-Brunn-Minkowski and Minkowski uniqueness

Recall:

- L^p-BM inequality (with equality condition) ⇔ L^p-Minkowski inequality (with equality condition).
- L^p-Minkowski inequality with equality condition ⇔ p-Minkowski uniqueness.

Local L^p-Brunn-Minkowski and Minkowski uniqueness

Recall:

- L^p-BM inequality (with equality condition) ⇔ L^p-Minkowski inequality (with equality condition).
- L^p-Minkowski inequality with equality condition ⇔ p-Minkowski uniqueness.

Also, L^{p} -BM $\Rightarrow L^{q}$ -BM with equality condition for any $q \in (p, 1]$.

Local L^p-Brunn-Minkowski and Minkowski uniqueness

Recall:

- L^p-BM inequality (with equality condition) ⇔ L^p-Minkowski inequality (with equality condition).
- L^p-Minkowski inequality with equality condition ⇔ p-Minkowski uniqueness.

Also, L^p -BM $\Rightarrow L^q$ -BM with equality condition for any $q \in (p, 1]$.

These implications also hold true locally. So Kolesnikov-Milman yields local *p*-Minkowski uniqueness for $p \in (p_0(n), 1]$.

- L^p-Minkowski inequality with equality condition ⇔ p-Minkowski uniqueness.

Also, L^p -BM $\Rightarrow L^q$ -BM with equality condition for any $q \in (p, 1]$.

These implications also hold true locally. So Kolesnikov-Milman yields local *p*-Minkowski uniqueness for $p \in (p_0(n), 1]$.

Chen-Huang-Li-Liu, by PDE methods, showed that local *p*-Minkowski uniqueness implies global *p*-Minkowski uniqueness.

Yields equivalence of local and global L^p -BM in general, and in particular proves L^p -BM for $p \in [p_0(n), 1]$.

Pairs of strongly isomorphic polytopes are dense in $\mathcal{K}^n \times \mathcal{K}^n$.

・ 同 ト ・ ヨ ト ・ ヨ ト

Pairs of strongly isomorphic polytopes are dense in $\mathcal{K}^n \times \mathcal{K}^n$.

For strongly isomorphic polytopes K, L, one can compute $(\operatorname{vol}(K_{\lambda})^{\frac{P}{n}})''$ at any "good" λ and obtain the same formula as in the smooth and strongly convex case.

Pairs of strongly isomorphic polytopes are dense in $\mathcal{K}^n \times \mathcal{K}^n$.

For strongly isomorphic polytopes K, L, one can compute $(vol(K_{\lambda})^{\frac{p}{n}})''$ at any "good" λ and obtain the same formula as in the smooth and strongly convex case.

However, in this case the behavior of K_{λ} is very simple: it changes its s.i. class only at a finite set of points in [0, 1], and on each subinterval, $(\operatorname{vol}(K_{\lambda})^{\frac{p}{n}})''$ exists and is given by the local formula.

Pairs of strongly isomorphic polytopes are dense in $\mathcal{K}^n \times \mathcal{K}^n$.

Lemma

Let K_t be a family of polytopes with facet normals u_i , support numbers $h_{K_t}(u_i) = h_i(t)$, and facet volumes $F_i(t)$. Then $vol(K_t)' = \sum h'_i(t)F_i(t)$.

The lemmata enable us to compute $\operatorname{vol}(K_{\lambda})'$. But if the K_{λ} are strongly isomorphic, then each facet of K_{λ} satisfies the assumptions of the lemma as well, which lets us compute $\log \operatorname{vol}(K_{\lambda})''$. The result is the local log-BM formula.

Local-to-global - some details (2)

So assuming the local log-BM inequality, for any neighborhood $U \subset [0, 1]$ in which all the $\{K_{\lambda} : \lambda \in U\}$ are strongly isomorphic, we have $\log \operatorname{vol}(K_{\lambda})'' \leq 0$. How do we go from here to a proof that local log-BM implies global log-BM?

Essentially, this boils down to the question of when K_{λ} can change its strong isomorphism class. Let's start with an easier question: when does a polytope defined by varying support numbers $h_i(\lambda)$ lose or gain a facet?

Essentially, this boils down to the question of when K_{λ} can change its strong isomorphism class. Let's start with an easier question: when does a polytope defined by varying support numbers $h_i(\lambda)$ lose or gain a facet?

It turns out that this boils down to some linear inequalities involving h_i and other support numbers. The same holds true for lower-dimensional faces, whose support numbers are linear combinations of the original ones.

So assuming the local log-BM inequality, for any neighborhood $U \subset [0, 1]$ in which all the $\{K_{\lambda} : \lambda \in U\}$ are strongly isomorphic, we have $\log \operatorname{vol}(K_{\lambda})'' \leq 0$. How do we go from here to a proof that local log-BM implies global log-BM?

Essentially, this boils down to the question of when K_{λ} can change its strong isomorphism class. Let's start with an easier question: when does a polytope defined by varying support numbers $h_i(\lambda)$ lose or gain a facet?

It turns out that this boils down to some linear inequalities involving h_i and other support numbers. The same holds true for lower-dimensional faces, whose support numbers are linear combinations of the original ones.

But since the $h_i(\lambda)$ are analytic, any linear combination of them can change sign only at a finite number of points in [0, 1]. So we obtain that log vol $(K_{\lambda})'$ is decreasing except at a finite number of points in [0, 1], and a continuity argument finishes the proof.

Local Log-BM in dimension 2

For $K, L \in \mathcal{K}_e^2$, define the inradius and circumradius of L w.r.t.K:

$$r(L, K) = \min_{u \in S^{n-1}} \frac{h_L(u)}{h_K(u)}$$
 $R(L, K) = \max_{u \in S^{n-1}} \frac{h_L(u)}{h_K(u)}$

< 回 > < 回 > < 回 >

Local Log-BM in dimension 2

For $K, L \in \mathcal{K}_{e}^{2}$, define the inradius and circumradius of L w.r.t.K:

$$r(L, K) = \min_{u \in S^{n-1}} \frac{h_L(u)}{h_K(u)} \qquad R(L, K) = \max_{u \in S^{n-1}} \frac{h_L(u)}{h_K(u)}$$

By Blaschke's extension of the Bonnesen inequality, for any $t \in [r(L, K), R(L, K)]$ we have

$$\operatorname{vol}(L) - 2tV(L,K) + t^2\operatorname{vol}(K) \leq 0$$
